

Cisco 350-001-LAB

Exam Name: CCIE-ROUTING AND SWITCHING QUALIFICATION (Lab exam)

Q & A : 0 Q&As

Pdf Demo

Quality and Value for the 350-001-LAB Exam

[Just4Exams Practice Exams](#) for Cisco CCIE 350-001-LAB are written to the highest standards of technical accuracy, using only certified subject matter experts and published authors for development.

100% Guarantee to Pass Your 350-001-LAB Exam

If you do not pass the CCIE 350-001-LAB exam on your first attempt using our Just4Exams **350-001-LAB testing engine and pdf study guide**, we will give you a FULL REFUND of your purchasing fee.

Downloadable, Interactive 350-001-LAB Testing engines and PDF Version

Our Exam Preparation Material provides you everything you will need to take a [CCIE certification](#) examination. Details are researched and produced by [Cisco Certification](#) Experts who are constantly using industry experience to produce precise, and logical.

Free 350-001-LAB Exams:

Exam : Cisco 350-001-LAB

Title : CCIE-Routing and Switching Written exam(4.1)

N1.

Answer:

Part-1: Bridge and Switching

1. 1 OSPF Bbackbones

- * The link between Sw1 and Sw2
- * All interface in VLAN_100 on Sw1 Sw2 R1 and R2
- * R3 G0/0 and G0/1 and the fa0/3 on Sw1 and Sw2
- * Loop back 0 interface on Sw1 Sw2 R2 and R3
- * Verifying that all OSPF neighbor have built their adjacencies

RackYYR1:
Router ospf YY
network YY.YY.12.1 0.0.0.0 area 0
network YY.YY.21.1 0.0.0.0 area 0

RackYYR2:
Router ospf YY
network YY.YY.2.2 0.0.0.0 area 0
network YY.YY.12.2 0.0.0.0 area 0
network YY.YY.21.2 0.0.0.0 area 0

RackYYSw1:
Router ospf YY
network YY.YY.7.7 0.0.0.0 area 0
network YY.YY.12.254 0.0.0.0 area 0
network YY.YY.13.2 0.0.0.0 area 0
network YY.YY.100.1 0.0.0.0 area 0

RackYYSw2:
Router ospf YY
network YY.YY.8.8 0.0.0.0 area 0
network YY.YY.21.254 0.0.0.0 area 0
network YY.YY.31.2 0.0.0.0 area 0
network YY.YY.100.2 0.0.0.0 area 0

RackYYR3:
Router ospf YY
network YY.YY.3.3 0.0.0.0 area 0
network YY.YY.13.1 0.0.0.0 area 0
network YY.YY.31.1 0.0.0.0 area 0
Verify: show ip ospf interface brief; show ip ospf neighbor
2.2 OSPF over NBMA
* OSPF area 11 consist of the follow interface and attributes
* The Frame Relay network between R3 R4 R5
* Loop back 0 on R4 and R5
* VLAN_55
* Ensure there is no DR/BDR

RackYYR3:
interface s0/0/0.3
ip ospf network point-to-multipoint non-broadcast
Router ospf YY
network YY.YY.11.3 0.0.0.0 area 11
nei YY.YY.11.4
nei YY.YY.11.5

RackYYR4:
interface s0/0/0.4
ip ospf network point-to-multipoint non-broadcast
Router ospf YY
network YY.YY.4.4 0.0.0.0 area 11
network YY.YY.11.4 0.0.0.0 area 11

RackYYR5:
interface s0/0/0.5
ip os net point-to-multipoint non-broadcast
Router ospf YY
network YY.YY.5.5 0.0.0.0 area 11
network YY.YY.11.5 0.0.0.0 area 11
network YY.YY.55.254 0.0.0.0 area 11
Verify: show ip ospf interface brief; show ip ospf neighbor
2.3 OSPF ASBR and RIP version 2
* Configure R4 to receive RIP v2 routes from Backbone 1

- * When properly configured you will receive RIP v2 routes in the class B address range 199.172.Z.Z
- * Configure R4 so that the external RIP routes are injected into area 11 and appear throughout that OSPF domain
- * Ensure external routes originate from Autonomous Systems Boundary Routers (ASBR) outside area 11 cannot be flooded within the area
- * Permit OSPF type-3 routes into area 11 (Look in R5)

RackYYR4:

```
ip prefix-list fbb1 per 199.172.0.0/16 le 32
Router rip
version 2
no auto-summary
network 150.1.0.0
distribute-list prefix fbb1 in Fa0/0
Router ospf YY
redistribute rip metric-type 1 subnets
area 11 nssa
```

RackYYR3:

```
Router ospf YY
area 11 nssa
```

RackYYR5:

```
Router ospf YY
area 11 nssa
```

Verify: show ip protocol; show ip route rip; show ip ospf; show ip route ospf;
2.4 Area 34 and Area 43

- * OSPF area 34 consists of the VLAN_200 interfaces on Sw1 and Sw3 and loopback 0 in Sw3
- * OSPF area 43 consists of the VLAN_200 interfaces on Sw2 and Sw4 and loopback 0 in Sw4

RackYYSw1:

```
Router ospf YY
network YY.YY.34.1 0.0.0.0 area 34
```

RackYYSw2:

```
Router ospf YY
network YY.YY.43.1 0.0.0.0 area 43
```

RackYYSw3:

```
Router ospf YY
network YY.YY.9.9 0.0.0.0 area 34
network YY.YY.34.254 0.0.0.0 area 34
```

RackYYSw4:

```
Router ospf YY
network YY.YY.10.10 0.0.0.0 area 43
network YY.YY.43.254 0.0.0.0 area 43
Verify: show ip ospf interface brief; show ip ospf neighbor
```

2.5 OSPF ABR

- * Static routes are not permitted for this question
- * inject a default route into area 0 area 11 area 34 area 43
- * Use fewest number of steps or commands to complete this

RackYYR3:

```
Router ospf YY
area 11 nssa default-information-originate
default-information originate always
Verify: show ip route ospf; show ip ospf database
```

2.6 OSPF Summary

- * Add the following interface on R2 to Area 0
- * Loopback 22 180.88.22.254/24
- * Loopback 32 180.88.32.254/24
- * Loopback 47 180.88.47.254/24
- * Summarize the above address into a single route
- * Your summary route must be compact and not waste address space

* Verify the Summary is in the OSPF routing table on R5 and you can ping all the host address

* R3、 Sw 1、 Sw2 to make regional summary.

RackYYR2:

int lo22

ip address 180.88.22.254 255.255.255.0

int lo32

ip address 180.88.32.254 255.255.255.0

int lo47

ip address 180.88.47.254 255.255.255.0

Router ospf YY

network 180.88.0.0 0.0.63.255 area 0

Here I choose loopback interface directly in three IOS12.4 versions used after the interface declared ospf support. That fast, and not an error.

RackYYR3/Sw1/Sw2:

Router ospf YY

area 0 range 180.88.0.0 255.255.192.0

Verify; show ip ospf; show ip route ospf; show ip ospf database

(If the announcement of OSPF loop, IP add is 24 bits, I use all is point-to-point type)

2.7 RIP version 2

* Advertise all the individual YY.YY.0.0 network prefixes generated within your lab topology to backbone 1

* Instruct the backbone 1 router that your networks are 5 hops away

* Filter all other prefixes to backbone 1

1: RackYYR4:

Access-list 4 per YY.YY.0.0 0.0.255.255

Router rip

Redistribute ospf yy metric 1

Offset-list 4 out 4 g0/0

Distribute-list 4 out g0/0

Verify: debug ip rip

2: router rip

Redistribute os 8 metric 5 route-map fromOSPF

Route-map fromOSPF per 10

Match ip add prefix-list fromOSPF

Ip prefix-list fromOSPF per 8.8.0.0/16 le 32

Using a heavy distributed orders will solve the three requirements. Our slogan is the strategy to solve the problem with a minimum of job, to minimize CPU consumption. And into the routing database RIP 8.8.0.0 only 16.

3. router rip

Redis os 8 route-map fromOSPF

Default-metric 5

Route-map fromOSFP per 10

Match ip add fromOSPF

Ip access-list standard fromOSPF

Per 8.8.0.0 0.0.255.255

4. router rip

Redis os 8 route-map fromOSPF

Route-map fromOSPF per 10

Set metric 5

Distribute-list prefix fromOSPF out os 8

Ip prefix-list fromOSPF per 8.8.0.0/16 le 32

The source method the worst, To execute the job finished three strategy needs.

2.8 EIGRP

* EIGRP 100 AS 100 consists of the following interface

* The Frame Relay network between R1 and R6

* Loopback0 on R1 and R6

* The BB2 interface on R6 should appear as an external EIGRP route on R1

* R6 must have a single 16 bit prefix via R1 to the YY.YY.0.0 network. Do not use route filters or automatic summary

* Redistribute EIGRP routes into ospf area

RackYYR1:

Ip prefix-list eto per YY.YY.0.0/16

Route-map eto deny 10

Match ip add pre eto

```

Route-map eto per 20
ip prefix-list ote seq 5 permit 0.0.0.0/0
route-map ote deny 10
match ip address prefix-list ote
route-map ote permit 20
Router eigrp 100
No au
Net YY.YY.16.1 0.0.0.0
Net YY.YY.1.1 0.0.0.0
Redistribute ospf YY metric 10000 100 255 1 1500 route-map ote
Router os yy
Redistribute eigrp 100 subnets metric-type 1 route-map eto
Int s0/0/0
Ip summary ei 100 YY.YY.0.0 255.255.0.0

```

RackYYR6:

```

Route-map con per 10
Match interface E0/1
Router eigrp 100
No au
Net YY.YY.16.6 0.0.0.0
Net YY.YY.6.6 0.0.0.0
Redistribute connected route-map CON metric 10000 100 255 1 1500

```

Verify: show ip protocol; show ip route eigrp; show ip route ospf;

2.9 EIGRP over BB3

* The backbone 3 router will be sending some class A,B and C IP prefixes

* Create a prefix-list and apply it so that the EIGRP process will only accept prefixes in the class C address might on the routing table

* Deny all routes to BB3

(Here should notice first octet=192-200)

Prefix list access list

```

A:0.0.0.0/1 le 32 0.0.0.0 127.255.255.255
B:128.0.0.0/2 le 32 128.0.0.0 63.255.255.255
C:192.0.0.0/3 le 32 192.0.0.0 31.255.255.255

```

RackYYR6:

```

Ip prefix-list fbb3 per 192.0.0.0/5 le 32
Ip prefix-list fbb3 per 200.0.0.0/8 le 32
Ip prefix-list tbb3 deny 0.0.0.0/0 le 32

```

Router eigrp 100

Net 150.3.YY.1 0.0.0.0

Distribute-list prefix fbb3 in F0/0

Distribute-list prefix tbb3 out F0/0

Verify: show ip protocol; show ip route eigrp

BGP

* R1: Loopback 200: 200.1YY.101.1/32

* R2: Loopback 200: 200.1YY.102.1/32

* R3: Loopback 200: 200.YY.3.1/32

* R4: Loopback 200: 200.YY.4.1/32

* R5: Loopback 200: 200.YY.5.1/32

* R6: Loopback 200: 200.1YY.106.1/32

7.1 IBGP

* Configure IBGP as follows

* AS YY: Configure only R3 R4, and R5 to be part of the AS YY, R3 is the Route-Reflector for this AS

* AS 1YY: Configure only R1, R2 and R6 to be part of the AS 1YY. Don't configure RR or confederation in the AS

* You can use any IP address to form the IBGP peers

* Advertise the loopback 200 on all BGP routers through BGP and make sure you are able to ping these loopbacks from inside each AS

* Loopback 200:

* AS YY: 200.YY.X.1/32

* AS 1YY: 200.1YY.10X.1/32

RackYYR3:

Router bgp YY

no auto-summary

no synchronization

bgp Router-id YY.YY.3.3

network 200.YY.3.1 mask 255.255.255.255

neighbor YY.YY.2.2 remote-as 10YY
neighbor YY.YY.2.2 update-source Loopback0
Verify: show ip bgp summary; show ip bgp
7.2 EGP
```

Configure EBGP as follows

* R6 EBGP peers with BB2 IP address 150.2.YY.254 AS 254

* R1 EBGP peers with R3

* R2 EBGP peers with R3

* You can use any IP address to form the EBGP peers

* Make sure all routers in AS YY have the EBGP routes from AS 254 via 1YY on their BGP and IP routing tables. You do not need to ping these routes

* Make sure you are able to ping the loop back 200 from all BGP routers on both AS. You are permitted to use 4 static routes within minimum mask to fulfill this Requirement

RackYYR6:

```
Router bgp 10YY
neighbor 150.2.YY.254 remote-as 254
neighbor 150.2.YY.254 local-as YY no-prepend
```

RackYYR1:

```
Router bgp 10YY
neighbor YY.YY.3.3 remote-as YY
neighbor YY.YY.3.3 ebgp-multihop 255
neighbor YY.YY.3.3 update-source Loopback0
```

RackYYR2:

```
Router bgp 10YY
```

```
neighbor YY.YY.3.3 remote-as YY
neighbor YY.YY.3.3 ebgp-multihop 255
neighbor YY.YY.3.3 update-source Loopback0
```

RackYYR3:

```
Router bgp YY
Neighbor YY.YY.1.1 remote-as 10YY
Neighbor YY.YY.2.2 remote-as 10YY
Neighbor YY.YY.1.1 update-source loop0
Neighbor YY.YY.2.2 update-source loop0
Neighbor YY.YY.1.1 ebgp-multihop 255
Neighbor YY.YY.2.2 ebgp-multihop 255
```

RackYYSw1:

```

Verify: show ip bgp; show ip bgp community

Part-3: IP Feature

(Multicast eight points, eight points, safety QOS8 points, IP properties eight points, total 32 points)

IP IOS feature

3.1 Exception handling

* Configure R4 to enable exception handling

* Filename:R4-DUMP Username:ccie Password:cisco

* Ftp address: 150.1.YY.254

RackYYR4:

ip ftp username ccie

ip ftp password cisco

exception protocol ftp

exception dump150.1.YY.254

exception corefile R4-DUMP

3.2 System logging

? Buffer alert critical emergencies and error

? Set the buffer size to 8192

? Indicate the date and time for each logged entry

RackYYR5:

logging on

logging buffered 8192 errors

clock timezone GMT 8

clock set hh:mm:ss month year

service timestamps log datetime local-time year show-timezone

Verify: show logging;

(All the time is like all equipment in good, I finally see configuration of all the equipment has been a time, and Windows of time)

3.3 DHCP

* Configure R5 to provide the following parameters for DHCP client on VLAN_55

* IP address

* DNS server YY.YY.55.60 and YY.YY.55.67

* Domain:cisco.com

* Default gateway

* Hosts must retain DHCP assigned address 10 days

* Permit only secure ARP entries to be installed in R5's ARP table

RackYYR5:

Service dhcp

Security

6.1 Tracing Traffic Source to Device under Attack

* It is suspected that Dos attack is being launched at host 150.3.YY.254 select an appropriate device to configure so that you can start tracing the source of this attack.

* Your solution must meet the following criteria

* The result of the trace must be sent to syslog once a day

* This device is limited to trace to one IP address only

* DO NOT configure ACL to achieve this

RackYYR5:

ip source-track 150.1.YY.254

ip source-track address-limit 1

ip source-track syslog-interval 1440

Verify: show ip source-track; show ip source-track

6.2 IP Fragment Attacking

* R4 picked up an BB1 from source is to address, with the attack and destination is a web server: 10.1.y.5 requirements

R4 stop these attacks, and allow the other traffic flow through

Rack11R4:

```
ip access-list extended FRAGMENT
```

```
deny ip any host 10.1.yy.5 fragment
```

```
permit ip any any
```

```
int g0/0
```

```
ip access-group FRAGMENT in
```

6.3 Catalyst Security

* On Sw1-Fa0/7 configure 802.1.x authentication meeting the following When clients that do not

RackYYSw1:

```
aaa new-model
```

```
aaa authentication dot1x default group radius
```

```
aaa authorization network default group radius
```

```
dot1x system-auth-control
```

```
dot1x guest-vlan supplicant
```

```
int Fa0/7
```

```
Switchport mode access
```

```
dot1x port-control auto
```

```
dot1x guest-vlan 55
```

```
dot1x host-mode multi-host
```

Verify: show dot1x all; show dot1x interface interface-id details

QOS

4.1 Congestion Avoidance Notification

* Configure R1-S0/0/0 such that is out bound traffic has utilized 75% of total bandwidth.

* R1 should sign that the network is congested and the recipients need to slow down sending packets.

* DO NOT configure Frame Relay BECN or FECN for this question

RackYYR1:

```
Ip tcp ecn
```

```
Policy-map QOS
```

```
class class-default
```

```
bandwidth percent 75
```

```
random-detect
```

```
random-detect ecn
```

```
interface s0/0/0
```

```
no random-detect
```

```
service-policy output QOS
```

Verify: show policy-map interface interface-id

4.2 Traffic policing

* Client on VLAN_BB1 and VLAN_55 access a URL located on VLAN_BB2 frequently. This URL is <http://www.this website.com/directory>.

* Select one suitable router to configure, so as to conserve bandwidth meeting the following criteria.

* Traffic from this URL back to these clients should not exceed 640000 bits per second.

* If the files download from this URL are image file then drop the traffic

* You may assume image the names end with the suffix:*.gif*.jpg or *.jpeg

RackYYR6:

```
ip cef
```

```
ip access-list extended TRAFFIC
```

```
permit ip 150.2.YY.0 0.0.0.255 150.1.YY.0 0.0.0.255
```

```
permit ip 150.2.YY.0 0.0.0.255 YY.YY.55.0 0.0.0.255
```

```
class-map match-all url
```

```
match access-group name TRAFFIC
```

```
match protocol http host www.thiSwebsite.com
```

```
match protocol http url /directory /*
```

```
class-map match-all pic
```

```
match class-map url
```

```
match protocol http url *.jpg|*.jpeg|*.gif
```

```
policy-map NBAR
```

```
class pic
```

```
drop
```

```
class url
```

```
police cir 64000
```

```
interface Gi0/1
service-policy input NBAR
ip nbar protocol-discovery
```

Verify: show policy-map interface interface-id

4.3 Discard Eligible and Traffic Shaping

* The Frame Relay link on R5 is experiencing heavy congesting. Configure R5 so that the Frame Relay provider does not drop any routing protocol packets during

* congesting and if the number of packets in R5's Frame Relay interface queue exceeds 10, then the traffic rate will be reduced to 32000 bps.

RackYYR5:

```
access-list 105 deny ospf any any
access-list 105 deny tcp any eq 179 any
access-list 105 deny tcp any any eq 179
access-list 105 deny pim any any
access-list 105 permit ip any any
frame-relay de-list 1 protocol ip list 105
interface s0/0.5
frame-relay de-group 1 503
map-class frame-relay FRTS
Frame-Relay adaptive-shaping interface-congestion 10
Frame-Relay mincir 32000
interface Serial0/0
Frame-Relay traffic-shaping
interface Serial0/0.5
Frame-Relay interface-dlci 503
class FRTS
```

Verify: show frame-relay pvc dlci

Multicast

5.1 Sparse Mode Multicasting

* There is a multicast source for group 224.2.2.2 located at VLAN_BB2 and another source for group 224.3.3.3 located at VLAN_BB3. There are clients on VLAN_55 that would like to access these two groups.

* Configure R5, R3, Sw1, R1 and R6 to meet the following requirements

* Configure all devices using sparse mode

* R1 will be the RP for both multicast groups and R3 will be backup RP. Use the most reliable way to achieve this objective and do not configure RP information statically

* R5 needs to be able to ping both 224.2.2.2 and 224.3.3.3

RackYYR6:

```
ip multicast-routing
int g0/1
ip pim sparse-mode
ip igmp join-group 224.2.2.2 (This configuration is used)
int g0/0
ip pim sparse-mode
ip igmp join-group 224.3.3.3 (This configuration is used)
int s0/0/0
ip pim sparse-mode
ip pim nbma-mode
```

RackYYR1:

```
ip multicast-routing
int s0/0/0
ip pim sparse-mode
ip pim nbma-mode
int g0/0
ip pim sparse-mode
int lo200
ip pim sparse-mode
ip pim send-rp-ann LO200 sco 10 group-list 11
ip pim send-rp-dis LO200 sco 10
```

```
access-list 11 per 224.2.2.2
```

```
access-list 11 per 224.3.3.3
```

RackYYSw1:

```
ip multicast-routing
int VLAN 100
ip pim sparse-mode
int Fa0/3
ip pim sparse-mode
```

RackYYR3:

```
ip multicast routing
int g0/0
ip pim sparse-mode
int s0/0/0.3
ip pim sparse-mode
ip pim nbma-mode
ip pim dr-priority 200
int lo0
ip pim sparse-mode
ip pim send-rp-ann Loopback0 sco 10 group-list 33
ip pim send-rp-dis Loopback0 sco 10
access-list 33 permit 224.2.2.2
access-list 33 permit 224.3.3.3
```

RackYYR5:

```
ip multicast-routing
int s0/0/0.5
ip pim sparse-mode
ip pim nbma-mode
```

```
int g0/0
```

```
ip pim sparse-mode
```

Verify: show ip pim neighbor; show ip pim rp mapping; R5 ping group addresses 224.2.2.2 and 224.3.3.3;

5.2 Defense against Multicast Dos Attack

* There is a concern that hacker launch Dos attack against R5 with multicast group membership traffic. Configure R5 so that accept only 100 IGMP reports at any time but this limit does not apply to the group 224.3.3.3.

RackYYR5:

```
ip access-list extended 105
permit igmp any host 224.3.3.3
int g0/0
ip igmp limit 110 except 105
```

Verify: show ip igmp interface interface-i

2. router rip

```

```

```
Route-map fromOSPF per 10
```

```
Set metric 5
```

```
Distribute-list prefix fromOSPF out os 8
```

```
Ip prefix-list fromOSPF per 8.8.0.0/16 le 32
```

The source method the worst, To execute the job finished three strategy needs.

2.8 EIGRP

* EIGRP 100 AS 100 consists of the following interface

* The Frame Relay network between R1 and R6

* Loopback0 on R1 and R6

* The BB2 interface on R6 should appear as an external EIGRP route on R1

* R6 must have a single 16 bit prefix via R1 to the YY.YY.0.0 network. Do not use route filters or automatic summary

* Redistribute EIGRP routes into ospf area

RackYYR1:

```
Ip prefix-list eto per YY.YY.0.0/16
Route-map eto deny 10
Match ip add pre eto
Route-map eto per 20
ip prefix-list ote seq 5 permit 0.0.0.0/0

Redistribute connected route-map CON metric 10000 100 255 1 1500
Verify: show ip protocol; show ip route eigrp; show ip route ospf;
```

2.9 EIGRP over BB3

* The backbone 3 router will be sending some class A,B and C IP prefixes

* Create a prefix-list and apply it so that the EIGRP process will only accept prefixes in the class C address might on the routing table

* Deny all routes to BB3

(Here should notice first octet=192-200)

Prefix list access list

```
A:0.0.0.0/1 le 32 0.0.0.0 127.255.255.255
B:128.0.0.0/2 le 32 128.0.0.0 63.255.255.255
C:192.0.0.0/3 le 32 192.0.0.0 31.255.255.255
```

RackYYR6:

```
Ip prefix-list fbb3 per 192.0.0.0/5 le 32
Ip prefix-list fbb3 per 200.0.0.0/8 le 32
Ip prefix-list tbb3 deny 0.0.0.0/0 le 32
Router eigrp 100
Net 150.3.YY.1 0.0.0.0
Distribute-list prefix fbb3 in F0/0
Distribute-list prefix tbb3 out F0/0
Verify: show ip protocol; show ip route eigrp
```

Security

6.1 Tracing Traffic Source to Device under Attack

* It is suspected that Dos attack is being launched at host 150.3.YY.254 select an appropriate device to configure so that you can start tracing the source of this attack.

* Your solution must meet the following criteria

* The result of the trace must be sent to syslog once a day

* This device is limited to trace to one IP address only

* DO NOT configure ACL to achieve this

RackYXR5:

ip source-track 150.1.YY.254

ip source-track address-limit 1

```
ip source-track syslog-interval 1440
```

```
Verify: show ip source-track; show ip source-track
```

6.2 IP Fragment Attacking

* R4 picked up an BB1 from source is to address, with the attack and destination is a web server: 10.1.y.5 requirements

R4 stop these attacks, and allow the other traffic flow through

Rack11R4:

```
ip access-list extended FRAGMENT
```

```
deny ip any host 10.1.yy.5 fragment
```

```
permit ip any any
```

```
int g0/0
```

```
ip access-group FRAGMENT in
```

6.3 Catalyst Security

* On Sw1-Fa0/7 configure 802.1.x authentication meeting the following When clients that do not

RackYYSw1:

```
aaa new-model
```

```
aaa authentication dot1x default group radius
```

```
aaa authorization network default group radius
```

```
dot1x system-auth-control
```

```
dot1x guest-vlan supplicant
```

```
int Fa0/7
```

```
Switchport mode access
```

```
dot1x port-control auto
```

```
dot1x guest-vlan 55
```

```
dot1x host-mode multi-host
```

```
Verify: show dot1x all; show dot1x interface interface-id details
```

QOS

4.1 Congestion Avoidance Notification

* Configure R1-S0/0/0 such that is out bound traffic has utilized 75% of total bandwidth.

* R1 should sign that the network is congested and the recipients need to slow down sending packets.

* DO NOT configure Frame Relay BECN or FECN for this question

RackYYR1:

```
Ip tcp ecn
```

```
Policy-map QOS
```

```
class class-default
```

```
bandwidth percent 75
```

```
random-detect
```

```
random-detect ecn
```

```
interface s0/0/0
```

```
no random-detect
```

```
service-policy output QOS
```

```
Verify: show policy-map interface interface-id
```

4.2 Traffic policing

* Client on VLAN_BB1 and VLAN_55 access a URL located on VLAN_BB2 frequently. This URL is <http://www.this website.com/directory>.

* Select one suitable router to configure, so as to conserve bandwidth meeting the following criteria.

* Traffic from this URL back to these clients should not exceed 640000 bits per second.

* If the files download from this URL are image file then drop the traffic

* You may assume image the names end with the suffix:*.gif*.jpg or *.jpeg

RackYYR6:

```
ip cef
```

```
ip access-list extended TRAFFIC
```

```
permit ip 150.2.YY.0 0.0.0.255 150.1.YY.0 0.0.0.255
```

```
permit ip 150.2.YY.0 0.0.0.255 YY.YY.55.0 0.0.0.255
```

```
class-map match-all url
```

```
match access-group name TRAFFIC
```

```
match protocol http host www.thiSwebsite.com
```

```
match protocol http url /directory /*
```

```
class-map match-all pic
```

```
match class-map url
```

```
match protocol http url *.jpg|.jpeg|.gif
```

```
policy-map NBAR
```

```
class pic
```

```
drop
class url
police cir 64000
interface Gi0/1
service-policy input NBAR
ip nbar protocol-discovery
Verify: show policy-map interface interface-id
```

4.3 Discard Eligible and Traffic Shaping

* The Frame Relay link on R5 is experiencing heavy congesting. Configure R5 so that the Frame Relay provider does not drop any routing protocol packets during

* congesting and if the number of packets in R5's Frame Relay interface queue exceeds 10, then the traffic rate will be reduced to 32000 bps.

RackYYR5:

```
access-list 105 deny ospf any any
access-list 105 deny tcp any eq 179 any
access-list 105 deny tcp any any eq 179
access-list 105 deny pim any any
access-list 105 permit ip any any
frame-relay de-list 1 protocol ip list 105
interface s0/0.5
frame-relay de-group 1 503
map-class frame-relay FRTS
Frame-Relay adaptive-shaping interface-congestion 10
Frame-Relay mincir 32000
interface Serial0/0
Frame-Relay traffic-shaping
interface Serial0/0.5
Frame-Relay interface-dlci 503
class FRTS
Verify: show frame-relay pvc dlci
```

Multicast

5.1 Sparse Mode Multicasting

* There is a multicast source for group 224.2.2.2 located at VLAN_BB2 and another source for group 224.3.3.3 located at VLAN_BB3. There are clients on VLAN_55 that would like to access these two groups.

* Configure R5, R3, Sw1, R1 and R6 to meet the following requirements

* Configure all devices using sparse mode

* R1 will be the RP for both multicast groups and R3 will be backup RP. Use the most reliable way to achieve this objective and do not configure RP information statically

* R5 needs to be able to ping both 224.2.2.2 and 224.3.3.3

RackYYR6:

```
ip multicast-routing
int g0/1
ip pim sparse-mode
ip igmp join-group 224.2.2.2 (This configuration is used)
int g0/0
ip pim sparse-mode
ip igmp join-group 224.3.3.3 (This configuration is used)
int s0/0/0
ip pim sparse-mode
ip pim nbma-mode
```

RackYYR1:

```
ip multicast-routing
int s0/0/0
ip pim sparse-mode
ip pim nbma-mode
int g0/0
ip pim sparse-mode
int lo200
ip pim sparse-mode
ip pim send-rp-ann LO200 sco 10 group-list 11
ip pim send-rp-dis LO200 sco 10
```

```
access-list 11 per 224.2.2.2
access-list 11 per 224.3.3.3
RackYYSw1:
ip multicast-routing
int VLAN 100
ip pim sparse-mode
int Fa0/3
ip pim sparse-mode
```

```
RackYYR3:
ip multicast routing
int g0/0
ip pim sparse-mode
int s0/0/0.3
ip pim sparse-mode
ip pim nbma-mode
ip pim dr-priority 200
int lo0
ip pim sparse-mode
ip pim send-rp-ann Loopback0 sco 10 group-list 33
ip pim send-rp-dis Loopback0 sco 10
access-list 33 permit 224.2.2.2
access-list 33 permit 224.3.3.3
```

```
RackYYR5:
ip multicast-routing
int s0/0/0.5
ip pim sparse-mode
ip pim nbma-mode
```

```
int g0/0
ip pim sparse-mode
```

Verify: show ip pim neighbor; show ip pim rp mapping; R5 ping group addresses 224.2.2.2 and 224.3.3.3;

5.2 Defense against Multicast Dos Attack

* There is a concern that hacker launch Dos attack against R5 with multicast group membership traffic. Configure R5 so that accept only 100 IGMP reports at any time but this limit does not apply to the group 224.3.3.3.

```
RackYYR5:
```

```
ip access-list extended 105
permit igmp any host 224.3.3.3
int g0/0
ip igmp limit 110 except 105
```

Verify: show ip igmp interface interface-i

3. 1 Sparse Mode Multicasting

* There is a multicast source for group 224.2.2.2 located at VLAN_BB2 and another source for group 224.3.3.3 located at VLAN_BB3. There are clients on VLAN_55 that would like to access these two groups.

* Configure R5, R3, Sw1, R1 and R6 to meet the following requirements

* Configure all devices using sparse mode

* R1 will be the RP for both multicast groups and R3 will be backup RP. Use the most reliable way to achieve this objective and do not configure RP information statically

* R5 needs to be able to ping both 224.2.2.2 and 224.3.3.3

```
RackYYR6:
```

```
ip multicast-routing

access-list 11 per 224.2.2.2
access-list 11 per 224.3.3.3
```

RackYYSw1:

```
ip multicast-routing
int VLAN 100
ip pim sparse-mode
int Fa0/3
ip pim sparse-mode
```

RackYYR3:

```
ip multicast routing
int g0/0
ip pim sparse-mode
int s0/0/0.3
ip pim sparse-mode
ip pim nbma-mode
ip pim dr-priority 200
int lo0
ip pim sparse-mode
ip pim send-rp-ann Loopback0 sco 10 group-list 33
ip pim send-rp-dis Loopback0 sco 10
access-list 33 permit 224.2.2.2
access-list 33 permit 224.3.3.3
```

RackYYR5:

```
ip multicast-routing
int s0/0/0.5
ip pim sparse-mode
ip pim nbma-mode
```

int g0/0

```
ip pim sparse-mode
```

Verify: show ip pim neighbor; show ip pim rp mapping; R5 ping group addresses 224.2.2.2 and 224.3.3.3;

5.2 Defense against Multicast Dos Attack

* There is a concern that hacker launch Dos attack against R5 with multicast group membership traffic. Configure R5 so that accept only 100 IGMP reports at any time but this limit does not apply to the group 224.3.3.3.

RackYYR5:

```
ip access-list extended 105
permit igmp any host 224.3.3.3
int g0/0
ip igmp limit 110 except 105
```

Verify: show ip igmp interface interface-i

4. 1 vtp

* Sw1/Sw2/Sw3/Sw4

* VTP domain:VTP+YY

* VTP mode:Transparent

RackYYSw1/SW2/SW3/SW4:

```
vtp domain VTPYY
vtp mode transparent
```

that's not need to use s/c mode in VTP

Verify: show vlan brief

When u done, u must verify careful.

1.3 Port-channel between Sw1 a Sw2

* Sw1 and Sw2 layer 3 Ether channel use port-channel 21 only

* Assign YY.YY.100.1/24 to Sw1 Port-channel 21

* Assign YY.YY.100.2/24 to Sw2 Port-channel 21

* ensure interface F0/23 and F0/24 are channel member for both Switch

* Do not reply on PAGP or LACP to facilitate the connection

* Verify layer 2 and layer 3 connectivity via the channel link

RackYYSw1:

interface range FastEthernet0/23-24

shutdown

no Switchport

channel-group 21 mode on

no shutdown

interface Port-channel21

ip address YY.YY.100.1 255.255.255.0

RackYYSw2:

```
interface range FastEthernet0/23-24
```

```
shutdown
```

```
no Switchport
```

```
channel-group 21 mode on
```

```
no shutdown
```

```
interface Port-channel21
```

```
ip address YY.YY.100.2 255.255.255.0
```

Verify: show vtp status; show etherchannel summary; show etherchannel port-channel;

1.4 Port-channel between Sw1-Sw3 and Sw2-Sw4

* Sw1-Sw3 Sw2-Sw4 layer 2 Ether-channels use port 10 only F0/19 and F0/20 are members of the switches

* On Sw2 and Sw4 assign all interface in the EC as static-access port on VLAN_200 unconditional enable PAGP to facility the connection

* verify layer 2 connectivity via the channel link

RackYYSw1:

```
interface range FastEthernet0/19-20
```

```
shutdown
```

```
Switchport trunk encapsulation isl
```

```
Switchport mode trunk
```

```
channel-group 10 mode desirable
```

```
no shutdown
```

RackYYSw3:

```
interface range FastEthernet0/19-20
```

```
shutdown
```

```
Switchport trunk encapsulation isl
```

```
Switchport mode trunk
```
