In this diagram, Host G is attempting to send a packet to Host A through Router E. All routers are running EIGRP, and Router E has installed the following route in its routing table:

10.1.1.0/24 via router F

What will occur when Router E receives packets from Host G that are destined for Host A?

- A. E cannot have a route to 10.1.1.0/24 through F; so it will always choose the path through C.
- B. This is a routing loop; E will forward the traffic to F, and F will send the traffic back to E.
- C. Router E will forward the traffic to Router F.
- D. Router E will forward the traffic to Router F and send a 'host not reachable this direction' ICMP packet to Host G.
- E. Router E will forward the traffic to Router F and send an ICMP redirect to Host G.

8. To maintain schema-consistency in an LDAP Directory Information Tree (DIT), the LDAP standard specifies that:

- A. The client first downloads the DIT schema from the server and then makes sure every request it sends conforms to the schema;

The server therefore doesn't have to check DIT for consistency

- B. The operator periodically scans the DIT to check that the schema is not violated, and manually corrects any inconsistencies caused by clients
- C. The server periodically scans the DIT to check that the schema is not violated, and sends a notification to the operator when it finds an inconsistency caused by clients
- D. The server periodically converts the DIT to an SQL database; Schema-checking is done by the SQL engine and then the database is converted back to a DIT
- E. The server checks every client operation for schema consistency, and ignores requests that would result in a DIT inconsistency

In this network, Host A is trying to reach Host D. There is no routing protocol running, but Router B and C have the following static routes configured:

Router B: ip route 10.1.3.0 255.255.255.0 ethernet 1

Router C: ip route 10.1.1.0 255.255.255.0 ethernet 1

- A. This will not work because Router B has no idea of how to forward traffic to the 10.1.3.0/24 network.
- B. This will work because Router B will recognize that Router C is on the 10.1.2.0/24 network through a router discovery protocol and will forward traffic for 10.1.3.0/24 to Router C.
- C. This will not work because a broadcast interface in a static route command cannot be specified.
- D. This will work because Router B will ARP for Host D's IP address on the 10.1.2.0/24 network and Router C will answer.

Answer: D

20. A router is receiving updates for a subnet from different routing protocols. The administrator wishes to take advantage of a path via a route with a less favorable Administrative Distance. What can be done to affect this without losing any of the updates?

- B. Use the Router Configuration mode command distance with an appropriate 'weight' for this subnet
- C. Create a distribute-list to block this subnet
- D. Modify the default-metric weight of the routing protocol offering the more favorable Administrative Distance

Answer: B
